

Let us take again same example as above which passes two values using HTML FORM and submit button. We use same CGI script hello\_get.py to handle this input.

```
<form action="/cgi-bin/hello_get.py" method="post">
First Name: <input type="text" name="first_name"><br />
Last Name: <input type="text" name="last_name" />

<input type="submit" value="Submit" />
</form>
```

Here is the actual output of the above form. You enter First and Last Name and then click submit button to see the result.

First  Name:

Last Name:

Bottom of Form

## Passing Checkbox Data to CGI Program

Checkboxes are used when more than one option is required to be selected.

Here is example HTML code for a form with two checkboxes:

```
<form action="/cgi-bin/checkbox.cgi" method="POST" target="_blank">
<input type="checkbox" name="maths" value="on" /> Maths
<input type="checkbox" name="physics" value="on" /> Physics
<input type="submit" value="Select Subject" />
</form>
```

The result of this code is the following form:

☐ Maths ☐ Physics

Bottom of Form

Below is checkbox.cgi script to handle input given by web browser for checkbox button.
