

## Parameters

- NA

## Return Value

This method returns true if all characters in the string are digits and there is at least one character, false otherwise.

## Example

The following example shows the usage of `isdigit()` method.

```
#!/usr/bin/python

str = "123456"; # Only digit in this string
print str.isdigit();

str = "this is string example....wow!!!";
print str.isdigit();
```

When we run above program, it produces following result:

```
True
False
```

## 15. 13. islower()

### Description

The method **islower()** checks whether all the case-based characters (letters) of the string are lowercase.

### Syntax

Following is the syntax for **islower()** method:

```
str.islower()
```

## Parameters

- NA
