

Python Bitwise Operators

Bitwise operator works on bits and performs bit by bit operation. Assume if $a = 60$; and $b = 13$; Now in binary format they will be as follows:

$a = 0011\ 1100$

$b = 0000\ 1101$

$a \& b = 0000\ 1100$

$a | b = 0011\ 1101$

$a \wedge b = 0011\ 0001$

$\sim a = 1100\ 0011$

There are following Bitwise operators supported by Python language

Operator	Description	Example
& Binary AND	Operator copies a bit to the result if it exists in both operands.	$(a \& b) = 12$ (means 0000 1100)
Binary OR	It copies a bit if it exists in either operand.	$(a b) = 61$ (means 0011 1101)
\wedge Binary XOR	It copies the bit if it is set in one operand but not both.	$(a \wedge b) = 49$ (means 0011 0001)
\sim Binary Ones Complement	It is unary and has the effect of 'flipping' bits.	$(\sim a) = -61$ (means 1100 0011 in 2's complement form due to a signed binary number.
\ll Binary Left Shift	The left operands value is moved left by the number of bits specified by the right operand.	$a \ll 2 = 240$ (means 1111 0000)
