

When we run above program, it produces following result:

```
THIS IS STRING EXAMPLE....WOW!!!
```

## 41. 39. zfill (width)

### Description

The method **zfill()** pads string on the left with zeros to fill width.

### Syntax

Following is the syntax for **zfill()** method:

```
str.zfill(width)
```

### Parameters

**width** -- This is final width of the string. This is the width which we would get after filling zeros.

### Return Value

This method returns padded string.

### Example

The following example shows the usage of **zfill()** method.

```
#!/usr/bin/python

str = "this is string example....wow!!!";

print str.zfill(40);
print str.zfill(50);
```

When we run above program, it produces following result:

```
00000000this is string example....wow!!!
00000000000000000000this is string example....wow!!!
```
