

```
Phone.Pots()  
Phone.Isdn()  
Phone.G3()
```

When the above code is executed, it produces the following result:

```
I'm Pots Phone  
I'm 3G Phone  
I'm ISDN Phone
```

In the above example, we have taken example of a single functions in each file, but you can keep multiple functions in your files. You can also define different Python classes in those files and then you can create your packages out of those classes.
