42.	height: **Desired height of the widget; must be greater than or equal to 1.**
43.	underline: **Index of the character to underline in the widget's text (0 is the first character, 1 the second one, and so on).**
44.	width: **Desired width of the widget.**
45.	**Colors**

Tkinter represents colors with strings. There are two general ways to specify colors in Tkinter:

46.	**You can use a string specifying the proportion of red, green and blue in hexadecimal digits. For example, "#fff" is white, "#000000" is black, "#000fff000" is pure green, and "#00ffff" is pure cyan (green plus blue).**
47.	**You can also use any locally defined standard color name. The colors "white", "black", "red", "green", "blue", "cyan", "yellow", and "magenta" will always be available.**

Color options
The common color options are:

48.	activebackground: **Background color for the widget when the widget is active.**
49.	activeforeground: **Foreground color for the widget when the widget is active.**
50.	background: **Background color for the widget. This can also be represented as *bg*.**
51.	disabledforeground: **Foreground color for the widget when the widget is disabled.**
52.	foreground: **Foreground color for the widget. This can also be represented as *fg*.**
53.	highlightbackground: **Background color of the highlight region when the widget has focus.**
